

<b>Code</b>	STANDING_WAVE_RATIO.PY
<b>Author</b>	Nathaniel Heatwole, PhD ( <a href="mailto:heatwolen@gmail.com">heatwolen@gmail.com</a> ) ( <a href="#">GitHub</a> ) ( <a href="#">LinkedIn</a> )
<b>Summary</b>	Reproduces the design and likeness of a SWR/Watt cross-needle meter for assessing power levels and extent of mismatch for transmission lines.
<b>Methods/ process</b>	<p><a href="#">Standing wave ratio</a> (SWR):</p> <ul style="list-style-type: none"> <li>- Assesses extent of mismatch between a <a href="#">transmission line</a> and its load.</li> <li>- Unitless (ratio), <math>SWR \geq 1</math>, with greater values indicating less good matches.<sup>1</sup></li> <li>- Can be computed using (see <a href="#">reflection coefficient</a>): <ul style="list-style-type: none"> <li>- <i>Forward power (Watts)</i>: emanating from the transmitter.</li> <li>- <i>Reflected power (Watts)</i>: not accepted by the load (and reflected back to the transmitter).</li> </ul> </li> <li>- Extrema: <ul style="list-style-type: none"> <li>- <math>SWR = 1</math> -&gt; perfect match, indicating all forward power reaches and is accepted by the load (reflected power = 0).</li> <li>- <math>SWR = \infty</math> -&gt; perfect mismatch, indicating 100% of the forward power is reflected back (reflected power = forward power).</li> </ul> </li> <li>- Cross-needle SWR/Watt meter (see Figure 2), which is placed in the transmission line, simultaneously measures: <ul style="list-style-type: none"> <li>- <i>Forward power</i> (right needle).</li> <li>- <i>Reflected power</i> (left needle).</li> <li>- <i>SWR</i> (point where the two needles cross).</li> </ul> </li> </ul> <p>Steps:</p> <ol style="list-style-type: none"> <li>1. Generate the power curves (forward and reflected), as overlapping semi-circles.</li> <li>2. Generate the two needles (each rotating about a particular point).</li> <li>3. Generate the SWR curves, by looping over SWR and power level combinations, and simultaneously solving multiple equations for the coordinates where the two needles cross (2 equations / 2 unknowns).</li> <li>4. Demonstrate the functionality of the meter with various example scenarios.</li> </ol>
<b>Input</b>	User-specified SWR levels, power ranges, and power increments.
<b>Output</b>	<p>Plots – meter with:</p> <ul style="list-style-type: none"> <li>- Needles at rest (“first positions”)</li> <li>- Needles at maximums</li> <li>- Maximum forward power / perfect match</li> <li>- Forward power 150 Watts / <math>SWR = 2</math> (reflected power ~17 Watts)</li> <li>- Needles omitted</li> </ul>
<b>Results</b>	Reproduces the likeness and functionality of the cross-needle meter well.

---

<sup>1</sup> SWR are sometimes expressed in relative terms – e.g.,  $SWR = 3$  becomes 3:1 (“three-to-one”).
